

Executive Summary - Comes at first written at last

- 1. Problem Statement:** Airbnb users often leave the platform to research and compare reviews, ratings, prices, amenities, and other information across Google, travel websites, social media, and competing platforms, making booking decisions time-consuming; an agentic AI experience could proactively gather, compare, and summarize this information based on each user's preferences, helping them make faster, more confident decisions while staying within Airbnb.
- 2. Goals and Non-goals**
 - a. Goals**
 - i. Reduce the time users spend researching and comparing stays
 - ii. Keep users within the Airbnb platform during the decision-making journey
 - iii. Use agentic AI to provide personalized comparisons and recommendations
 - iv. Increase booking conversion
 - v. Build user trust in AI-assisted decisions
 - b. Non-goals**
 - i. Replace the user's final decision-making
 - ii. Build a complete end-to-end travel assistant
 - iii. Replace Airbnb's existing search and filters
 - iv. Collect every piece of information available online
 - v. Optimize solely for bookings
- 3. Success Metric**
 - a. **North Star Metric:** % of users who complete a booking after using the agentic AI to research and compare stays.
 - b. **L1** – Agent adoption rate, average number of comparisons per user, median time to booking decision.
 - c. **Counter** – Agent abandonment rate, recommendation rejection rate, D30 repeat usage rate.
- 4. User Journey - Empathy Map**

5. What is the competitor offering

- AI Review Summary** - Summarizes large volumes of reviews into the insights most relevant to the user's decision.
- Personalized Stay Comparison** - Compares stays based on the user's preferences, priorities, and key trade-offs.
- Agentic Research** - Researches relevant information across sources, compares options, and returns a personalized shortlist with reasoning.

RICE-inspired prioritization

Opportunity	Reach	Impact	Confidence	Effort	Priority
AI Review Summary	High	Med	High	Low	P0
Personalized Stay Comparison	High	High	High	Med	P1
Agentic Research	High	High	Med	High	P2

6. Functional and Acceptance Criteria / Non-functional Requirements

- Functional requirement:** StayMate should allow users to ask questions or specify preferences through natural language and use AI to research, summarize, and compare relevant stays. It should proactively gather relevant information from available sources, explain trade-offs between stays, and provide a personalized shortlist while keeping the user within Airbnb. The user should remain in control of the final booking decision.

b. **Non-functional requirement:**

- i. **P - Performance** - AI-generated research, summaries, and comparisons should be delivered within an acceptable response time without disrupting the booking journey.
- ii. **Q - Quality** - Recommendations and summaries should be accurate, relevant to the user's preferences, and based on reliable available information.
- iii. **R - Reliability** - Users should be able to revisit, refine, and re-trigger their research or comparisons without losing their preferences or previous context.
- iv. **S - Security** - User preferences, search behavior, and personal information should be securely handled and protected throughout the experience.
- v. **T - Transparency** - AI-generated recommendations should clearly communicate relevant information sources, key trade-offs, and the reasoning behind recommendations.
- vi. **U - Usability** - Users should be able to research, compare, and evaluate stays with minimal effort and without needing to leave Airbnb.
